

MICROPLASTIC POLLUTION

Infographic

Threat to planetary and human health

Microplastics pose a significant threat to both human and planetary health. These tiny, non-biodegradable fragments of plastic debris usually originate from the degradation of primary plastic sources, and make their way into the environment, jeopardizing the welfare of animals, humans, and various ecosystems.

Plastic production skyrocketing

6300 metric tons (Mt) of plastic waste have been produced as of 2015

Inadequate waste management
